SONY

DIGITAL VIDEO CAMERA

Equipped with the Global Shutter CMOS Sensor

GigE Vision®
XCG-CG Series

A new series of PoE compatible GigE Vision interface digital camera equipped with a Global Shutter CMOS Sensor.

Optimal replacement camera modules, inheriting equal size and high reliability, for CCD equipped digital and analog cameras.

Responds to high speed and high sensitivity needs unique to Global Shutter CMOS, allowing use of various features.

Cubic Size
- ■ **Dimensions: 29 (W) x 29 (H) x 42 (D) mm (Same dimensions as XCG-C series)**
  *excluding protrusions

Feature-rich
- ■ **Area gain**
- ■ **Shading correction**
- ■ **Look Up Table (LUT)**
- ■ **Temperature readout**
- ■ **Multi ROI***
- ■ **Defect correction**
- ■ **3 x 3 filter**
- ■ **Binning ***

  *Only XCG-CG160/CG160C   **Only XCG-CG160

System Optimization
- ■ **PoE specification support**
- ■ **IEEE1588**
- ■ **Mounting position same as XCG-C Series analog cameras**

Pregius   *Exmor*

GigE VISION   **PoE support**

2/3-type 5.1 MP 23 fps
XCG-CG510   (B/W)
XCG-CG510C   (Color)

1/2.9-type 1.6 MP 75 fps
XCG-CG160   (B/W)
XCG-CG160C (Color)

1/1.2-type 2.4 MP 41 fps
XCG-CG240   (B/W)
XCG-CG240C (Color)

Characteristics

■ High Frame Rate

Select either "Frame rate priority" or "Full feature available" mode.

Model name	Frame rate priority Mode 0		Full feature available Mode 1	
XCG-CG510 XCG-CG510C	8 bit	23 fps	8/10/12 bit	15 fps
			YUV422	11 fps
			RGB24	7 fps
XCG-CG240 XCG-CG240C	8 bit	41 fps	8/10/12 bit	32 fps
	10 bit	33 fps	YUV422	25 fps
			RGB24	17 fps
XCG-CG160 XCG-CG160C	8 bit	70 fps	8/10/12 bit	45 fps
	10 bit	45 fps	YUV422	37 fps
			RGB24	25 fps

■ IEEE1588

IEEE1588 is a protocol that synchronizes the clock on the network.
Exposure synchronization is possbile with several cameras via Ethernet cable.

[IEEE1588 Characteristics]
• Synchronization accuracy of sub μ seconds
• A synchronization system that isn't hardware dependent is constructible
• Composed of PTP master and slave (cameras, etc.)

Systemization simplified due to IEEE1588.
[Merits]
• All camera time stamps are synchronized to the master time
• Exposure synchronization in error range sub μ seconds possible without having to connect trigger lines
• The accuracy for date and time information of time stamps enhanced.
• When time synchronization starts, shooting images will be synchronized in free run with the set interval

• PTP Master Feature

When using the IEEE1588 feature, a grand master and slave composition is required.
Operating 1 camera as a master in environments where a grand master cannot be prepared allows synchronization between cameras.
An arbitrary time can be set via PC.

"IEEE1588 unsupported PC" (ex. Windows)

(1) Setting an absolute time to the Master camera from the PC
(1) Setting
Master
Master Time
Slave
Slave
(2) Synchronized
(2) Each Slave camera synchronizes the absolute time with the Master camera

■ Free Set Sequence

Perform exposure several times (max. 10 patterns) and GPO output with 1 trigger signal.
You can arbitrarily set the start time and length as well as the gain of the exposure and GPO output.
The set series of exposure and GPO output is counted as 1 cycle, and this cycle can be repeated.

[Merits]
• Set different lighting, exposure, and gain for each different detected subject as well as perform inspection of each detected subject

[Example]

Trigger
"GPO output (Strobe Active)"
Exposure
Gain
Camera output
■ Burst Trigger

This is a feature capable of continuous shooting at the trigger timing and specifying the number of exposures, exposure interval, and exposure time.
Select from the mode that repeats one exposure time or the mode that switches between 2 exposure times repeatedly.
Furthermore, there is another mode that repeats only while the trigger signal is on.

[Merits]
• Optimal for capturing synchronized images with several cameras
• Optimal when 2 exposures are necessary due to the difference in brightness of the subject

(A) When 1 pattern of exposure time is set
Set the number of exposures (1), exposure interval (2), and exposure time (3)
Continuous shooting at the trigger timing
[Example]

Trigger
Exposure
Camera output
Set 1 type of exposure setting (3)
Set number of exposures (1)
Set exposure interval (2)
(B) When 2 patterns of exposure times are set
Set the number of exposures (1), exposure interval (2), and exposure time (3)
Continuous shooting at the trigger timing

[Example]

Trigger
Exposure
Camera output
Set 2 type of exposure setting (3)
Set number of exposures (1)
Set exposure interval (2)

■ Bandwidth Control Feature

(1) Memory shot (when shooting continuously)
This feature allows you to save a specified amount of camera images to the camera and perform image output at your desired timing.
Optimal when requiring simultaneous exposure, but there are several cameras connected to the same network and the configuration makes the bandwidth exceed 1Gbps when operated simultaneously.
Optimal when shooting several shots.

Exposure start
Sending of command
Exposure
Imager readout
Camera output
Reached the specified amount Event issued

(2) Output timing control (when shooting 1 shot with 1 trigger)
Normally, images are sequentially output when exposure ends, but the image output start timing can be delayed.
Optimal when requiring simultaneous exposure, but there are several cameras connected to the same network and the configuration makes the bandwidth exceed 1Gbps when operated simultaneously.
Optimal when shooting 1 shot with single frame or trigger.

Cam1
Exposure
Imager readout
Camera output
Cam2
Exposure
Imager readout
Camera output
■ Area Gain

Individually set digital gain (0 to 32 times) to any of the 16 rectangular areas.
If several rectangular areas overlap, the gain value of the rectangular area with a smaller area number is prioritized.
Optimization of images for parts is available during parts inspection, etc.

When area gain is OFF   When area gain is ON

*Sample image   *Sample image

In case setting Gain=2 at Area 0 and Area 1

■ Multi ROI   *Only XCG-CG160/CG160C

Arbitrarily read out images including any 2 (max.) rectangular area from the maximum effective imaging area.
Due to this, you will be capable of limiting read out information, thus accelerating the frame rate.

■ Binning   *only XCG-CG160

Supports binning in vertical and horizontal 2 pixel units and increases frame rate without changing the angle of view as well as enhances the sensitivity.

1456(H) x 1088(V)
3.45μm

728(H) x 544(V)
6.9μm

Binning
2 vertical pixels
2 horizontal pixels

Angle of view	**Sustained**
Sensitivity	**4 times**
fps	**Approx. 4 times**

■ Other Features

• Trigger Range Limitation
You can choose to receive only the signal of the set trigger width as a trigger signal.
It functions as a noise filter that eliminates chattering and disturbance noise of the trigger signal line.
Furthermore, exposure start can be delayed following the set value of the trigger range if a trigger signal is input.

• Defect Correction
Corrects white defect points and black defect points of the image sensor. Corrections start from the periphery of the pixel coordinates where defects were detected.
Select between factory default settings and user settings.

• 3 x 3 Filter
Apply various processing to the image through matrix operating in 3 x 3 pixels.
Perform processing including noise reduction, edge emphasizing, and contour extraction with 9 filter factor patterns.
• Shading Correction
Corrects shading that occurs due to peripheral light falloff, light source irregularity, etc. that are characteristics of the lens.
A number of user data can be saved as user settings.
XCG-CG510/CG510C   : 9 patterns
XCG-CG240/CG240C   : 20 patterns
XCG-CG160/CG160C   : 35 patterns

### • Image Flip
Images can be flipped vertically, horizontally, or 180°.

		ReverseX	
		0	1
ReverseY	0	Normal	Horizontal flip
	1	Vertical flip	180° rotation

Dimensions

Units: mm (inches)
